

mikroBUS Shuttle

PID: MIKROE-2882

Weight: 27 g

Combine click boards™ with ease

mikroBUS Shuttle is a small add-on board, which is intended to be used with Shuttle click, in order to expand the mikroBUSTM with additional stacking options. This small add-on board has one mikroBUSTM equipped on itself and it is connected to the Shuttle click via the flat ribbon cable (20cm). One Shuttle click can support up to four mikroBUS Shuttles, allowing simple and elegant stacking solution for click boardTM line of products.

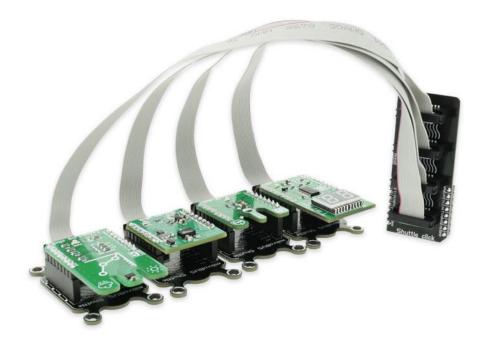

mikroBUS Shuttle is an ideal solution when there is a demand to have more click boards than the development system is able to support. Being connected with the flat ribbon cable to Shuttle click, mikroBUS Shuttle allows being freely positioned according to the requirements of the application. Four mounting holes on the corners of the mikroBUS Shuttle add-on board allow it to be fixed in the desired position.

How does it work?

mikroBUS Shuttle is designed as an add-on board for the Shuttle click, which carries one mikroBUSTM slot. Besides the mikroBUSTM slot, it is equipped with one ICD BOX header, used to connect mikroBUS Shuttle to the existing Shuttle click. It can be connected to one of the four available ICD BOX headers of the Shuttle click, with a flat ribbon cable.

mikroBUSTM socket on mikroBUS Shuttle can be populated with any click boardTM from our click boardTM range of products. If there is a need to fix mikroBUS Shuttle in a place, there are four mounting holes with the inner diameter of 3.2mm, that can be used for this purpose. This way, the click boardsTM can be stacked in a very simple and practical way. Having this kind of stacking topology, allows for easy manipulation and reconfiguration of the stacked click boardsTM, retaining a perfect connection quality at all times.

When there's a need to expand the development system with even more mikroBUSTM slots, one of the free mikroBUS shuttles can be populated with yet another Shuttle click, allowing even more connections. This makes the stacking capacity almost unlimited. However, attention should be paid not to make mikroBUSTM lines too long. In situations like this, the frequency of the communication might need to be stepped down a bit, in order to compensate for the longer mikroBUSTM signal lines.

Since all of the four headers available on the Shuttle click share the same mikroBUSTM lines, an extra care should be taken when working with click boardsTM that share the same pins on the mikroBUSTM, either for the communication (SPI, UART, I2C) or for some other purpose (RST, INT, or other pins used as GPIO). For example, I2C and 1-Wire protocols are designed with stacking in mind, so the collision avoidance mechanisms are already in place for these protocols. It is enough to change the slave address of the click boardTM and data collision won't be a problem anymore, even while sharing the same pins for the communication.

Also, since all the stacked click boardsTM share the same power rails, a care should be taken when combining click boardsTM with significant power consumption. The power consumption from all the click boardsTM combined should not exceed the maximum power that a development system can deliver.

Click board™ product range

The union of Shuttle click, mikroBUS Shuttle and click boards[™] allows you to reach an unlimited number possibilities when it comes to combining different functionalities. You just need to choose the ones you want from our ever-growing range: environmental sensors, LEDs, speech recognition, heart rate sensors, motor control, GSM, GPS, WiFi, analog to digital converters, movement sensors.

More than 400 click boardsTM that can be stacked and integrated in a simple and convenient way are at your disposal.

Turn your development system into a mikroBUS shuttle station!

Pinout diagram

This table shows the pinout on the mikroBUS™ socket.

Notes	of mikro™ BUS				Notes
Analog Input	1	AN	PWM	16	PWM Output
Reset	2	RST	INT	15	Hardware Interrupt
SPI Chip Select	3	CS	RX	14	UART Receive
SPI Clock	4	SCK	TX	13	UART Transmit
SPI Master Input Slave Output	5	MISO	SCL	12	I2C Clock
SPI Master Output Slave Input	6	MOSI	SDA	11	I2C Data
Power Supply		3.3V	5V	10	Power Supply
Ground		GND	GND	9	Ground

Onboard settings and indicators

Label	Name	Default	Description
J1	HM2X8	-	J1 Connector (IDC BOX header) has 16 pins, one for every mikroBUS™ pin. Flat ribbon cable enables connection with Shuttle click which has the same type of connector.
